4. DEVELOPMENT CHARACTER

4.1 The development proposals substantially accords with the Overall Regulating Plan set out within the Design Code.

URBAN FORM

4.2 Buildings and streets vary in their form and design to respond to the need to create variation in character. Development fronting the Primary Street has a tighter grain and is more dense, where as the streets to the green edges are more irregular.

4.3 The urban form seeks to respond to the existing and emerging context of the wider Swindon New Eastern Villages. As well as the development frontage changes, transitioning from a tighter grain and taller building elements to the centre to interspersed and organic nature to the edges.

ROAD ALIGNMENT

4.4 The road alignment fully accords with the principles of the design code in terms of east-west and south-north links.

HIERARCHY

4.5 The proposed road network accords with the Design Code and its parameters for adoption with alignment co-ordinated with other phases. This hierarchy is further reinforced with hard and soft landscaping proposals, as well as architecture.
